HOTEL WATER SOURCE REPLACEMENT SOLUTION

The horizontal Versatec 300 Series of Water Source Heat Pumps (WSHP's) are specifically designed for the tight space of a hotel application. Changes in the energy codes over the past 20 years have forced other manufacturers to grow the physical height of their cabinets, making it impossible to install their new units within the existing tight ceiling space and still have enough clearance below to fit the P-Trap. Other WSHP brands require noisy, field installed condensate pumps and expensive dedicated line voltage power outlets added above the ceiling by a separate contractor. Eliminate these additional costs and speed up your replacement schedule by using the WaterFurnace Versatec 300 Series 1/2 ton, 3/4 ton or 1 ton models thanks to a condensate drain located 3 1/2 inches above the bottom of the cabinet.

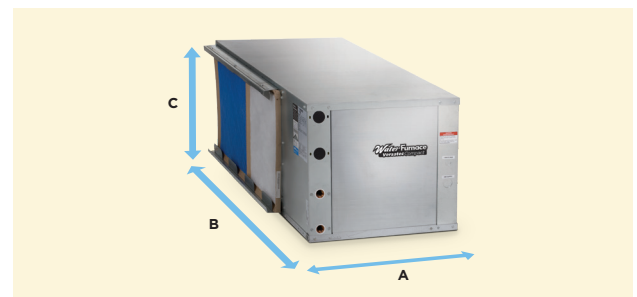

P-TRAP & CONDENSATE PIPING DESIGN

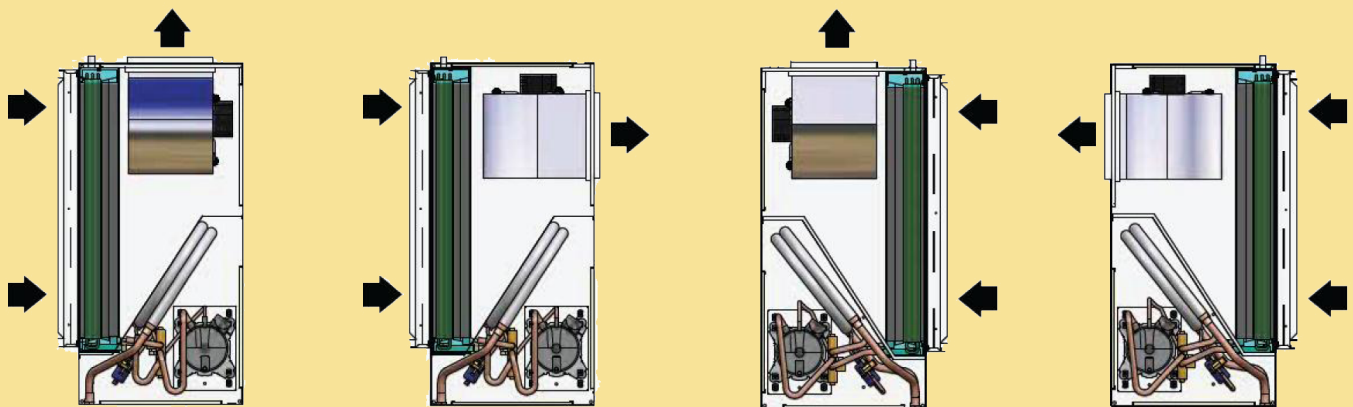

The WaterFurnace Versatec 300 1/2 ton, 3/4 ton and 1 ton units can be installed without the need for any additional clearance required below the unit. This allows the users to avoid a costly condensate pump as well as a line voltage power run.

Model	A	B	C
006-012	19.2"	35.0"	12.1"

Horizontal units shipped with standard 2 in. (field adjustable to 1 in.) open application filter rail extending 2.2 in. from the unit and are not suitable for duct connection. For ductable return connection applications, order the 2 in. (field adjustable to 1 in.) duct collar/filter rack which extends to 3.25 in. from the unit and is suitable for duct connections.

FOUR AIR FLOW PATTERNS TO CHOOSE FROM

Left hand return with end discharge

Left hand return with side discharge

Right hand return with end discharge

Right hand return with side discharge
